## A Message from the Dean

---

**We strive to develop medical professionals who will be able to respond to social needs.**

With the advancement of medical care, our social needs for pharmaceutical education are changing in terms of content and quality. At present, society not only demands medical professionals who have specialized knowledge in medicine, but also those who are equipped with the skills and attitude to respond to the needs of patients and the public, those who can take on the role of pharmacists in team medical care, and those who can make a wide range of contributions to medicine through the development of medicine for advanced medical care and other means. Given such demands, the School of Pharmaceutical Sciences, based on the university's educational philosophy of linking and integrating health care, medical care, and welfare, has been striving to develop medical professionals who will be able to respond to changes in advanced medical care and social needs by instilling students with a rich sense of humanity and high ethical standards that they will need as medical professionals.
