

Division of Physiology Department of Oral Biology

Outline

We study the autonomic regulation of the orofacial blood flow that is important for maintaining orofacial functions such as mastication, salivation and swallowing. We focus on 1) peripheral and central mechanisms neurally-mediated vasomotor responses, especially the parasympathetic vasodilation, 2) interaction between neural (autonomic nerves) and humoral responses (e.g. sympathoadrenal system) and 3) the physiological role of neurally-mediated vasomotor response in the control of hemodynamics in the orofacial area. We directly observe the effect of sensory inputs (trigeminal afferent), neurotransmitters or hormones on the blood flow in the orofacial tissues (facial skin, submandibular gland and jaw muscles etc.) and systemic hemodynamics (heart rate and blood pressure) in the anesthetized animals or human. Our new results are helping us to understand how autonomic nervous system operates effectively in a wide range of conditions associated with health and disease. In addition, they can provide a strong framework to identify and investigate new avenues for therapeutic treatments of orofacial dysfunctions associated with disturbances in the autonomic nervous system.

Faculty members

Professor;
Hisayoshi Ishii, D.D.S., Ph.D.

Hisayoshi ISHII

Toshiya SATO

Rina Ishikawa

Senior Lecturer;
Toshiya Sato, D.D.S., Ph.D.

Assistant Professor;
Rina Ishikawa, D.D.S., Ph.D.

Postgraduate student (4th grade);
Kohei Mito, D.D.S.

Kohei MITO

Ratna Ramadhani

Postgraduate student (3rd grade);
Ratna Ramadhani, M.Sc.

Main research in progress

- 1) Age-related changes in hemodynamics in orofacial area and their mechanisms
- 2) Parasympathetic reflex vasodilation in the salivary glands
- 3) Modulation of parasympathetic reflex vasodilation mediated by GABAergic system in the orofacial tissues
- 4) Regulatory system of hemodynamics in the orofacial area mediated by interaction between oxytocin and parasympathetic vasodilation
